Edelkalk/Edelbinder

| SCHWENK Edelkalk MC5 | SCHWENK Edelbinder MC 5 |

1.2 Relevant identified uses of the substance or mixture and uses advised against

Cements are used in industrial installations to manufacture/formulate hydraulic binders for building and construction work, such as ready-mixed concrete, mortars, renders, grouts, plasters as well as precast concrete.

Common cements and cement containing mixtures (hydraulic binders) are used industrially, by professionals as well as by consumers in building and construction work, indoor and outdoor. The identified uses of cements and cement containing mixtures cover the dry products and the products in a wet suspension (paste).

A list of uses for professional users, indicating the process categories and descriptors according to ECHA Guidance R.12 (ECHA-2010-G-05) are listed in section 16.

1.3 Details of the supplier of the safety data sheet

SCHWENK Zement KG, Werksgruppe Süd, Werk Allmendingen, Fabrikstraße, D-89604 Allmendingen
Information telephone number: Department of Quality/Laboratory: +49 7391 581-0

SCHWENK Zement KG, Werksgruppe Nord, Werk Bernburg, Altenburger Chaussee 3, D-06406 Bernburg
Information telephone number: Department of Quality/Laboratory: +49 3471 358-0

SCHWENK Zement KG, Werksgruppe Nord, Werk Karlstadt, Laudenbacher Weg 5, D-97753 Karlstadt
Information telephone number: Department of Quality/Laboratory: +49 9351 797-0

SCHWENK Zement KG, Werksgruppe Süd, Werk Mergelstetten, Hainenbachstraße 30, D-89522 Heidenheim
Information telephone number: Department of Quality/Laboratory: +49 7321 310-0

E-mail address of person responsible for the SDS: raiber.klaus@schwenk.de
1.4. Emergency telephone number

Emergency telephone number: +49 6131 19240 of the Giftnotrufzentrale Mainz
Hours of operation: 24 h a day German and English

SECTION 2: Hazards identification

2.1. Classification of the substance or mixture

2.1.1 According to Regulation (EC) No 1272/2008

<table>
<thead>
<tr>
<th>Hazard class</th>
<th>Hazard category</th>
<th>Classification procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skin irritation</td>
<td>2, H 315</td>
<td>On the basis of test data</td>
</tr>
<tr>

<td>1, H 318</td>
<td>On the basis of test data</td>
</tr>
<tr>
<td>Specific target organ toxicity single exposure respiratory tract irritation</td>
<td>3, H 335</td>
<td>experience at humans</td>
</tr>
</tbody>
</table>

Hazard statements

- H 318 Causes serious eye damage
- H 315 Causes skin irritation
- H 335 May cause respiratory irritation

2.1.2 Other information

Full text of the H phrases, hazard statements and EU risk phrases in section 16

Cement dust may cause irritation of the respiratory system. When cement reacts with water, for instance when making concrete or mortar, or when the cement becomes damp, a strong alkaline solution is produced. Due to the high alkalinity, wet cement may provoke skin and eye irritation.

2.2. Label elements

2.2.1 According to Regulation (EC) No 1272/2008

- P 280 Wear protective gloves/protective clothing/eye protection/face protection
- P 305 + P 351 + P 338 + P 310: IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a POISON CENTER or doctor/physician
- P 302 + P 352 + P 333 + P 313: IF ON SKIN: Wash with plenty of soap and water. If skin irritation or rash occurs: Get medical advice/attention
- P 261 + P 304 + P 340 + P 312: Avoid breathing dust/fume/gas/mist/vapours/spray. IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing. Call a POISON CENTER or doctor/physician if you feel unwell.
- P 102 Keep out of reach of children
- P 501 Dispose of contents/container to in accordance with local/regional/national/international regulations (to be specified)

Low Chromate with proper dry storage in bags for at least 6 months, bulk material for at least 2 months from date of delivery.

Supplemental information

Skin contact with wet Bodenbinder may cause irritation, dermatitis or burns.
May cause damage to products made of aluminium or other non-noble metals.

2.3. Other hazards

Cement does not meet the criteria for PBT or vPvB in accordance with Annex XIII of REACH (Regulation (EC) No 1907/2006).

The product contains chromate, whereby the content of water-soluble chromium (VI) is less than 0.0002%. (determined according to EN 196-10). At not proper storage (access of moisture) or superposition the chromate reducing agent may lose its effectiveness and it can not be excluded a sensitizing effect of the cement in contact with skin. (H 317 or EUH203)
SECTION 3: Composition/information on ingredients

3.1 Substance
Not applicable, since the product is a mixture

3.2 Mixtures

\(^1\) Flue Dust is a substance (UVCB), is generated by the production of cement clinker. Another common name is cement kiln dust and bypass flour, dust filter, EGR dust and clinker dust.

SECTION 4: First aid measures

4.1 Description of first aid measures

General notes
No personal protective equipment is needed for first aid responders. First aid workers should avoid contact with wet cement or wet cement containing preparations.

Following contact with eyes
Do not rub eyes in order to avoid possible cornea damage as a result of mechanical stress. Remove contact lenses if any. Incline head to injured eye, open the eyelid(s) widely and flush eye(s) immediately by thoroughly rinsing with plenty of clean water for at least 20 minutes to remove all particles. Avoid flushing particles into uninjured eye. If possible, use isotonic water (0.9 % NaCl). Contact a specialist of occupational medicine or an eye specialist.

Following skin contact
For dry cement, remove and rinse abundantly with water. For wet cement, wash skin with plenty of water. Remove contaminated clothing, footwear, watches, etc. and clean thoroughly before re-using them. Seek medical treatment in all cases of irritation or burns.

Following inhalation
Move the person to fresh air. Dust in throat and nasal passages should clear spontaneously. Contact a physician if irritation persists or later develops or if discomfort, coughing or other symptoms persist.

Following ingestion
Do not induce vomiting. If the person is conscious, wash out mouth with water and give plenty of water to drink. Get immediate medical attention or contact the anti poison centre.

4.2 Most important symptoms and effects, both acute and delayed

**Eyes:** Eye contact with cement (dry or wet) may cause serious and potentially irreversible injuries.

**Skin:** Cement may have an irritating effect on moist skin (due to sweat or humidity) after prolonged contact or may cause contact dermatitis after repeated contact. Prolonged skin contact with wet cement or wet concrete may cause serious burns because they develop without pain being felt (for example when kneeling in wet concrete even when wearing trousers).
For more details see Reference (1).

**Inhalation:** Repeated inhalation of dust of common cements over a long period of time increases the risk of developing lung diseases.

**Environment:** Under normal use, common cement is not hazardous to the environment.

### 4.3. Indication of any immediate medical attention and special treatment needed

When contacting a physician, take this SDS with you.

#### SECTION 5: Fire-fighting measures

**5.1. Extinguishing media**

Common cements are not flammable.

**5.2. Special hazards arising from the substance or mixture**

Cements are non-combustible and non-explosive and will not facilitate or sustain the combustion of other materials.

**5.3. Advice for fire-fighters**

Cement poses no fire-related hazards. No need for special protective equipment for fire fighters.

#### SECTION 6: Accidental release measures

**6.1. Personal precautions, protective equipment and emergency procedures**

**6.1.1 For non-emergency personnel**

Wear protective equipment as described under section 8 and follow the advice for safe handling and use given under section 7.

**6.1.2 For emergency responders**

Emergency procedures are not required. However, respiratory protection is needed in situations with high dust levels.

**6.2. Environmental precautions**

Do not wash cement down sewage and drainage systems or into bodies of water (e.g. streams).

**6.3. Methods and material for containment and cleaning up**

Collect the spillage in a dry state if possible.

**Dry cement**

Use cleanup methods such as vacuum clean-up or vacuum extraction (Industrial portable units, equipped with high efficiency particulate air filters (EPA and HEPA filters, EN 1822-1:2009) or equivalent technique) which do not cause airborne dispersion. Never use compressed air. Alternatively, wipe-up the dust by mopping, wet brushing or by using water sprays or hoses (fine mist to avoid that the dust becomes airborne) and remove slurry. If not possible, remove by slurrying with water (see wet cement). When wet cleaning or vacuum cleaning is not possible and only dry cleaning with brushes can be done, ensure that the workers wear the appropriate personal protective equipment and prevent dust from spreading. Avoid inhalation of cement and contact with skin. Place spilled materials into a container. Solidify before disposal as described under section 13.

**Wet cement**

Clean up wet cement and place in a container. Allow material to dry and solidify before disposal as described under section 13.

**6.4. Reference to other sections**

See sections 8 and 13 for more details.

### SECTION 7: Handling and storage

Do not handle or store near food and beverages or smoking materials.

**7.1. Precautions for safe handling**

**7.1.1 Protective measures**

Follow the recommendations as given under section 8. To clean up dry cement, see subsection 6.3.

**Measures to prevent fire**

Not applicable.

**Measures to prevent aerosol and dust generation**

Do not sweep. Use dry cleanup methods such as vacuum clean-up or vacuum extraction, which do not cause airborne dispersion.

**Measure to protect the environment**

No particular measures.
7.1.2 Information on general occupational hygiene

Do not handle or store near food and beverages or smoking materials. In dusty environment, wear dust mask and protective goggles. Use protective gloves to avoid skin contact.

7.2. Conditions for safe storage, including any incompatibilities

Bulk cement should be stored in silos that are waterproof, dry (i.e. with internal condensation minimised), clean and protected from contamination.

Engulfment hazard: To prevent engulfment or suffocation, do not enter a confined space, such as a silo, bin, bulk truck, or other storage container or vessel that stores or contains cement without taking the proper security measures. Cement can build-up or adhere to the walls of a confined space. The cement can release, collapse or fall unexpectedly.

Packed products should be stored in unopened bags clear of the ground in cool, dry conditions and protected from excessive draught in order to avoid degradation of quality.

Do not use aluminium containers due to incompatibility of the materials.

7.3. Specific end use(s)

No additional information for the specific end uses (see section 1.2).

7.4. Control of soluble Cr (VI)

For cements treated with a Cr (VI) reducing agent according to the regulations given in section 15, the effectiveness of the reducing agent diminishes with time. Therefore, cement bags and/or delivery documents will contain information on the packaging date, the storage conditions and the storage period appropriate to maintaining the activity of the reducing agent and to keeping the content of soluble chromium (VI) below 0.0002 % of the total dry weight of the cement ready for use, according to EN 196-10. They will also indicate the appropriate storage conditions for maintaining the effectiveness of the reducing agent.

SECTION 8: Exposure controls/personal protection

8.1. Control parameters

A = respirable fraction; E = Inhalable fraction

8.2. Exposure controls

8.2.1 Appropriate engineering controls

Measures to reduce generation of dust and to avoid dust propagating in the environment such as dedusting, exhaust ventilation and dry clean-up methods which do not cause airborne dispersion. If no appropriate exposure data are available, exposure estimation can be done by using MEASE [Reference (3)]. Technical control measures (table in 8.2.1) and individual protection measures (table in 8.2.2) are recommended for all identified uses (section 1.2).

For each individual PROC*, companies can choose from either option A) or B) in the two tables, according to what is best suited to their specific situation. If one option is chosen, then the same option (A and A or B and B) has to be chosen from the other table.

* PROC’s are identified uses and defined in section 16

### 8.2.2 Individual protection measures such as personal protection equipment

#### General
During work avoid kneeling in fresh mortar or concrete wherever possible. If kneeling is absolutely necessary then appropriate waterproof personal protective equipment must be worn.

Do not eat, drink or smoke when working with cement to avoid contact with skin or mouth.

Before starting to work with cement, apply a barrier creme and reapply it at regular intervals.

Immediately after working with cement or cement-containing materials, workers should wash or shower or use skin moisturisers. Remove contaminated clothing, footwear, watches, etc. and clean thoroughly before re-using them.

#### Eye/face protection
Wear approved glasses or safety goggles according to EN 166 when handling dry or wet cement to prevent contact with eyes.

#### Skin protection
Use impervious, abrasion and alkali resistant gloves (made of low soluble Cr (VI) containing material) internally lined with cotton, boots, closed long-sleeved protective clothing as well as skin care products (including barrier creams) to protect the skin from prolonged contact with wet cement. Particular care should be taken to ensure that wet cement does not enter the boots.

In some circumstances, such as when laying concrete or screed, waterproof trousers or kneepads are necessary.

#### Respiratory protection
When a person is potentially exposed to dust levels above exposure limits, use appropriate respiratory protection. The type of respiratory protection should be adapted to the dust level and conform to the relevant EN standard, (e.g. EN 149, EN 140, EN 14387, EN 1827) or national standard.

#### Thermal hazards
Not applicable.

<table>
<thead>
<tr>
<th>Exposure Scenario</th>
<th>PROC*</th>
<th>Exposure</th>
<th>Specification of respiratory protective equipment (RPE)</th>
<th>RPE efficiency - assigned protection factor (APF)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Industrial manufacture/formulation of cement</td>
<td>2, 3</td>
<td>D, G, L, A</td>
<td>not required</td>
<td>-</td>
</tr>
</tbody>
</table>
An overview of the APFs of different RPE (according to EN 529:2005) can be found in the glossary of MEASE [Reference (3)].

Any RPE as defined above shall only be worn if the following principles are implemented in parallel: The duration of work (compare with “duration of exposure” above) should reflect the additional physiological stress for the worker due to the breathing resistance and mass of the RPE itself, due to the increased thermal stress by enclosing the head. In addition, it shall be considered that the worker’s capability of using tools and of communicating are reduced during the wearing of RPE.

For reasons as given above, the worker should therefore be (i) healthy (especially in view of medical problems that may affect the use of RPE), (ii) have suitable facial characteristics reducing leakages between face and mask (in view of scars and facial hair). The recommended devices above which rely on a tight face seal will not provide the required protection unless they fit the contours of the face properly and securely.

The employer and self-employed persons have legal responsibilities for the maintenance and issue of respiratory protective devices and the management of their correct use in the workplace. Therefore, they should define and document a suitable policy for a respiratory protective device programme including training of the workers.

### 8.2.3 Environmental exposure controls

Environmental exposure control for the emission of cement particles into air has to be in accordance with the available technology and regulations for the emission of general dust particles. Environmental exposure control is relevant for the aquatic environment as emissions of cements in the different life-cycle stages (production and use) mainly apply to ground and waste water. The aquatic effect and risk assessment cover the effect on organisms/ecosystems due to possible pH changes related to hydroxide discharges. The toxicity of other dissolved inorganic ions is expected to be negligible compared to the potential pH effect.

Any effects that might occur during production and use would be expected to take place on a local scale. The pH of effluent and surface water should not exceed 9. Otherwise it could have an impact on municipal sewage treatment plants (STPs) and industrial waste water treatment plants (WWTPs). For that assessment of the exposure, a stepwise approach is recommended:

**Tier 1:** Retrieve information on effluent pH and the contribution of the cement on the resulting pH. Should the pH be above 9 and be predominantly attributable to cement, then further actions are required to demonstrate safe use.

**Tier 2:** Retrieve information on receiving water pH after the discharge point. The pH of the receiving water shall not exceed the value of 9.
Tier 3: Measure the pH in the receiving water after the discharge point. If pH is below 9, safe use is reasonably demonstrated. If pH is found to be above 9, risk management measures have to be implemented: the effluent has to undergo neutralisation, thus ensuring safe use of cement during production or use phase.

No special emission control measures are necessary for the exposure to the terrestrial environment.

SECTION 9: Physical and chemical properties

9.1. Information on basic physical and chemical properties

This information applies to the whole mixture.

(a) Appearance: Dry cement is a finely ground solid inorganic material (grey or white powder). Main particle size: 5 - 30 µm
(b) Odour: Odourless
(c) Odour threshold: No odour threshold, odourless
(d) pH: (T = 20 °C in water, water-solid ratio 1:2): 11 - 13.5
(e) Melting point: > 1,250 °C
(f) Initial boiling point and boiling range: Not applicable as under normal atmospheric conditions, melting point >1,250°C
(g) Flash point: Not applicable as is not a liquid
(h) Evaporation rate: Not applicable as is not a liquid
(i) Flammability (solid, gas): Not applicable as is a solid which is non combustible and does not cause or contribute to fire through friction
(j) Upper/lower flammability or explosive limits: Not applicable as is not a flammable gas
(k) Vapour pressure: Not applicable as melting point > 1,250 °C
(l) Vapour density: Not applicable as melting point > 1,250 °C
(m) Relative density: 2.75 - 3.20; Apparent density: 0.9 - 1.5 g/cm³
(n) Solubility(ies) in water (T = 20 °C): slight (0.1 - 1.5 g/l)
(o) Partition coefficient: n-octanol/water: Not applicable as is inorganic mixture
(p) Auto-ignition temperature: Not applicable (no pyrophoricity – no organo-metallic, organo-metalloid or organo-phosphine bindings or of their derivatives, and no other pyrophoric constituent in the composition)
(q) Decomposition temperature: Not applicable as no organic peroxide present
(r) Viscosity: Not applicable as not a liquid
(s) Explosive properties: Not applicable. Not explosive or pyrotechnic. Not in itself capable by chemical reaction of producing gas at such temperature and pressure and at such a speed as to cause damage to the surroundings. Not capable of a self-sustaining exothermic chemical reaction.
(t) Oxidising properties: Not applicable as does not cause or contribute to the combustion of other materials.

9.2. Other information

Not applicable.

SECTION 10: Stability and reactivity

10.1. Reactivity

When mixed with water, cements will harden into a stable mass that is not reactive in normal environments.

10.2. Chemical stability

Dry cements are stable as long as they are properly stored (see section 7) and compatible with most other building materials. They should be kept dry.

Contact with incompatible materials should be avoided.

Wet cement is alkaline and incompatible with acids, with ammonium salts, with aluminium or other non-noble metals. Cement dissolves in hydrofluoric acid to produce corrosive silicon tetrafluoride gas. Cement reacts with water to form silicates and calcium hydroxide. Silicates in cement react with powerful oxidizers such as fluorine, boron trifluoride, chlorine trifluoride, managanese trifluoride, and oxygen difluoride.

10.3. Possibility of hazardous reactions

Cements do not cause hazardous reactions.

10.4. Conditions to avoid

Humid conditions during storage may cause lump formation and loss of product quality.

10.5. Incompatible materials

Acids, ammonium salts, aluminium or other non-noble metals. Uncontrolled use of aluminium powder in wet cement should be avoided as hydrogen is produced.

10.6. Hazardous decomposition products

Cements will not decompose into any hazardous products.
### SECTION 11: Toxicological information

#### 11.1. Information on toxicological effects

<table>

<tr>
<td>Serious eye damage/irritation</td>
<td>1</td>
<td>Portland cement clinker caused a mixed picture of corneal effects and the calculated irritation index was 128. Common cements contain varying quantities of Portland cement clinker, fly ash, blast furnace slag, gypsum, natural pozzolans, burnt shale, silica fume and limestone. Direct contact with cement may cause corneal damage by mechanical stress, immediate or delayed irritation or inflammation. Direct contact by larger amounts of dry cement or splashes of wet cement may cause effects ranging from moderate eye irritation (e.g. conjunctivitis or blepharitis) to chemical burns and blindness.</td>
<td>(11), (12)</td>
</tr>
<tr>
<td>Skin sensitisation</td>
<td>1B</td>
<td>Some individuals may develop eczema upon exposure to wet cement dust, caused either by the high pH which induces irritant contact dermatitis after prolonged contact, or by an immunological reaction to soluble Cr (VI) which elicits allergic contact dermatitis. The response may appear in a variety of forms ranging from a mild rash to severe dermatitis and is a combination of the two above mentioned mechanisms. If the cement contains a soluble Cr (VI) reducing agent and as long as the mentioned period of effectiveness of the chromate reduction is not exceeded, a sensitising effect is not expected (Reference (9)).</td>
<td>(5), (13)</td>
</tr>
<tr>
<td>Respiratory sensitisation</td>
<td>-</td>
<td>There is no indication of sensitisation of the respiratory system. Based on available data, the classification criteria are not met.</td>
<td>(1)</td>
</tr>
<tr>
<td>Germ cell mutagenicity</td>
<td>-</td>
<td>No indication. Based on available data, the classification criteria are not met.</td>
<td>(14), (15)</td>
</tr>
<tr>
<td>Carcinogenicity</td>
<td>-</td>
<td>No causal association has been established between Portland cement exposure and cancer. The epidemiological literature does not support the designation of Portland cement as a suspected human carcinogen Portland cement is not classifiable as a human carcinogen (According to ACGIH A4: Agents that cause concern that they could be carcinogenic for humans but which cannot be assessed conclusively because of a lack of data. In vitro or animal studies do not provide indications of carcinogenicity that are sufficient to classify the agent with one of the other notations.). Based on available data, the classification criteria are not met.</td>
<td>(1)</td>
</tr>
<tr>
<td>Reproductive toxicity</td>
<td>-</td>
<td>Based on available data, the classification criteria are not met. No evidence from human experience</td>
<td></td>
</tr>
<tr>
<td>STOT-single exposure</td>
<td>3</td>
<td>Cement dust may irritate the throat and respiratory tract. Coughing, sneezing, and shortness of breath may occur following exposures in excess of occupational exposure limits. Overall, the pattern of evidence clearly indicates that occupational exposure to cement dust has produced deficits in respiratory function. However, evidence available at the present time is insufficient to establish with any confidence the dose-response relationship for these effects.</td>
<td>(1)</td>
</tr>
<tr>
<td>STOT-repeated exposure</td>
<td>-</td>
<td>There is an indication of COPD. The effects are acute and due to high exposures. No chronic effects or effects at low concentration have been observed. Based on available data, the classification criteria are not met.</td>
<td>(17)</td>
</tr>
<tr>
<td>Aspiration hazard</td>
<td>-</td>
<td>Not applicable as cements are not used as an aerosol.</td>
<td></td>
</tr>
</tbody>
</table>

Apart from skin sensitisation, Portland cement clinker and common cements have the same toxicological and eco-toxicological properties.

**Medical conditions aggravated by exposure**

Inhaling cement dust may aggravate existing respiratory system disease(s) and/or medical conditions such as emphysema or asthma and/or existing skin and/or eye conditions.
SECTION 12: Ecological information

12.1. Toxicity
The product is not hazardous to the environment. Ecotoxicological tests with Portland cement on Daphnia magna (U.S. EPA, 1994a) [Reference (6)] and Selenastrum col (U.S. EPA, 1993) [Reference (7)] have shown little toxicological impact. Therefore LC50 and EC50 values could not be determined [Reference (8)]. There is no indication of sediment phase toxicity [Reference (9)]. The addition of large amounts of cement to water may, however, cause a rise in pH and may, therefore, be toxic to aquatic life under certain circumstances.

12.2. Persistence and degradability
Not relevant as cement is an inorganic material. After hardening, cement presents no toxicity risks.

12.3. Bioaccumulative potential
Not relevant as cement is an inorganic material. After hardening, cement presents no toxicity risks.

12.4. Mobility in soil
Not relevant as cement is an inorganic material. After hardening, cement presents no toxicity risks.

12.5. Results of PBT and vPvB assessment
Not relevant as cement is an inorganic material. After hardening, cement presents no toxicity risks.

12.6. Other adverse effects
Not relevant.

SECTION 13: Disposal considerations

13.1. Waste treatment methods
Do not dispose of into sewage systems or surface waters.

Product - cement that has exceeded its shelf life
(and when demonstrated that it contains more than 0.0002 % soluble Cr (VI)): shall not be used/sold other than for use in controlled closed and totally automated processes or should be recycled or disposed of according to local legislation or treated again with a reducing agent.

Product - unused residue or dry spillage
Pick up dry unused residue or dry spillage as is. Mark the containers. Possibly reuse depending upon shelf life considerations and the requirement to avoid dust exposure. In case of disposal, harden with water and dispose according to “Product – after addition of water, hardened”

Product – slurries
Allow to harden, avoid entry in sewage and drainage systems or into bodies of water (e.g. streams) and dispose of as explained below under “Product - after addition of water, hardened”.

Product - after addition of water, hardened
Dispose of according to the local legislation. Avoid entry into the sewage water system. Dispose of the hardened product as concrete waste. Due to the inertisation, concrete waste is not a dangerous waste.

EWC entries: 10 13 14 (waste from manufacturing of cement – waste concrete or concrete sludge) or 17 01 01 (construction and demolition wastes - concrete).

Packaging
Completely empty the packaging and process it according to local legislation.

EWC entry: 15 01 01 (waste paper and cardboard packaging).

SECTION 14: Transport information

Cement is not covered by the international regulation on the transport of dangerous goods (IMDG, IATA, ADR/RID), therefore no classification is required. No special precautions are needed apart from those mentioned under section 8.

14.1. UN number
Not relevant.

14.2. UN proper shipping name
Not relevant.

14.3. Transport hazard class(es)
Not relevant.
**14.4. Packing group**
Not relevant.

**14.5. Environmental hazards**
Not relevant.

**14.6. Special precautions for user**
Not relevant.

**14.7. Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code**
Not relevant.

**SECTION 15: Regulatory information**

**15.1. Safety, health and environmental regulations/legislation specific for the substance or mixture**

Cement is a mixture according to REACH and is not subject to registration. Cement clinker is exempt from registration (Art 2.7 (b) and Annex V.10 of REACH).

The marketing and use of cement is subject to a restriction on the content of soluble Cr (VI) (REACH Annex XVII point 47 Chromium (VI) compounds):

1. Cement and cement-containing mixtures shall not be placed on the market, or used, if they contain, when hydrated, more than 2 mg/kg (0.0002 %) soluble chromium (VI) of the total dry weight of the cement.

2. If reducing agents are used, then without prejudice to the application of other Community provisions on the classification, packaging and labelling of substances and mixtures, suppliers shall ensure before the placing on the market that the packaging of cement or cement-containing mixtures is visibly, legibly and indelibly marked with information on the packing date, as well as on the storage conditions and the storage period appropriate to maintaining the activity of the reducing agent and to keeping the content of soluble chromium (VI) below the limit indicated in paragraph 1.

3. By way of derogation, paragraphs 1 and 2 shall not apply to the placing on the market for, and use in, controlled closed and totally automated processes in which cement and cement-containing mixtures are handled solely by machines and in which there is no possibility of contact with the skin.

4. The Standard for the examination of the content of water-soluble chromium VI of cement and cement-containing mixtures is approved by the European Committee for Standardization (CEN) as the standard method for documentation compliance with the requirements of the section 1.

The so-called “Good practice guides” which contain advice on safe handling practices can be found from: http://www.nepsi.eu/good-practice-guide.aspx. These good practices have been adopted under the Social Dialogue “Agreement on Workers’ Health Protection through the Good Handling and Use of Crystalline Silica and Products Containing it by Employee and Employer European sectoral associations, among which CEMBUREAU.

16.4 Relevant H-statements (number and full text):

H 315 Causes skin irritation
H 317 May cause an allergic skin reaction
H 318 Causes serious eye damage
H 335 May cause respiratory irritation
EUH 203 Contains chromium (VI). May cause allergic reactions.

16.6 Methods in accordance with Article 9 of Regulation (EC) 1272/2008 (CLP) to evaluate the information for classification purposes

The review was conducted in accordance with Article 6, paragraph 5 and Annex I to Regulation (EC) No. 1272/2008.

16.7 Training advice

In addition to health, safety and environmental training programs for their workers, companies must ensure that workers read, understand and apply the requirements of this SDS.

16.8 Disclaimer

The information on this data sheet reflects the currently available knowledge and is reliable provided that the product is used under the prescribed conditions and in accordance with the application specified on the packaging and/or in the technical guidance literature. Any other use of the product, including the use of the product in combination with any other product or any other process, is the responsibility of the user.

It is implicit that the user is responsible for determining appropriate safety measures and for applying the legislation covering his/her own activities.
